V4 Minkowski diagnostic snapshots: n=16, dt=0.0005, angular ε=2
Error grows rapidly
Maximum stored-field deviation
Volume
Actual scri surface
Original volume limit
Coordinate time
A thin radial boundary pattern
A projection / surface A amplitude
t=0.25
t=0.30
t=0.35
Compactified radius
The angular filter acts weakly
Isolated surface-Q damping quotient
Trajectory amplitude growth ≈ 73
(different measure; not an eigenvalue shift)
Coordinate time
All captures fail the original state-error limit. Radial profiles use global Cartesian A components and reference-area weights.
The changing direction is not a certified eigenmode; isolated Q response does not establish coupled stability.
