Angular dissipation prototype — operator consistency and energy, not evolution stability
Smooth spherical scalar/vector/tensor data
$\|Qu\|_\infty$, $\varepsilon = 1$
Cells per patch axis n
p=5, vector_x
p=5, tensor_01
p=5, harmonic_l6
p=7, vector_x
p=7, tensor_01
p=7, harmonic_l6
Nonpolynomial smooth field by face region
$\|Qu\|_\infty$, $\varepsilon = 1$
Cells per patch axis n
p=5, interior
p=5, edge
p=5, corner
p=7, interior
p=7, edge
p=7, corner
Dimensionless spectral scale
$\lambda(M^{-1/2}B^TMBM^{-1/2})$
Cells per patch axis n
p=5, certified bound
p=5, power Rayleigh
p=7, certified bound
p=7, power Rayleigh
Resolved n=6 V2 surface modes only
$-\mathrm{Re}(v^*MQv)/(v^*Mv)$
Polynomial degree
p=5, mode0
p=5, mode2
p=7, mode0
p=7, mode2
